We believe that the demand for advanced skill sets in business analytics area is growing, and to meet this demand and to make sure that our students have the required technical skills, we built a data science concentration that focuses on programming skills, using Python for building predictive models and utilizing Python's machine learning libraries to make sure that our students are very knowledgeable about machine learning techniques and also making sure that our students have the advanced skill set in data management using some of the Microsoft technologies. And also, more importantly, we wanted to make sure that our students are very good at building prescriptive models and making sure that they can learn about the optimization and statistical models to make better decisions. The important skills from our first course in programming will be they will be very good at programming in Python and also in our second course, they're going to learn about the advanced data management techniques and they're going to be very good at using SQL as a database management language and making sure that they can utilize the SQL servers and to build very useful data warehousing processes. In our third course they're going to learn about the advanced optimization techniques to be able to build better decisions. And they're going to more importantly, they are going to go into some deep learning and reinforcement learning. And they're going to also combine these two as deep reinforcement learning models to make sure that our students have the advanced skill sets to tackle complex business problems. The job paths that our students can take advantage from this concentration is the being a data scientist and being data engineer, and our students are also going to be very knowledgeable about machine learning techniques and building predictive models. So in terms of the machine learning specialist, they will be very good candidates. And our students are also going to learn about some of the data visualization and data exploration techniques using Python. So any job related to data visualization and data exploration will be very good for our students. And more importantly, our students will understand the complexity of building complex business processes. So from that perspective, they will be very good candidates for being application developers. They will know about the challenges of data management and challenges from building predictive and prescriptive models. And also they will be able to utilize the cloud computing systems very much in our in our concentration. So they will be very good at as cloud computing analysts as the job positions.
